

Group Art Unit 2863
Appln. No. 10/055,341
Reply to Office Action of June 17, 2003
Docket No. 1921-0138P

AMENDMENTS TO THE ABSTRACT OF THE DISCLOSURE:

Please replace Abstract of the Disclosure currently of record with the attached new Abstract of the Disclosure set out on the attached sheet.

ABSTRACT OF THE DISCLOSURE

A3
A system for inspecting thermal equipment includes a communication line for connecting a facility site and a management center to each other. At the facility site, an operating state information collecting device collects information related to operating states of the thermal equipment. An information processing device fetches the information via the communication line and executes creation of report data for recording related to inspection data of the thermal equipment and delivers the created report data to the facility site. A center-side modem is interposed between the information processing device and the communication line. An output device provided at the facility site outputs a report based on the delivered report data. The report data is stored in a data storage device at each time of creation of the report data. Thus, the system inspecting thermal equipment allows for a reduction in labor.
